

Problem Statement:

We are doing a data analysis to investigate people's perception about Netflix.

Survey Questions:

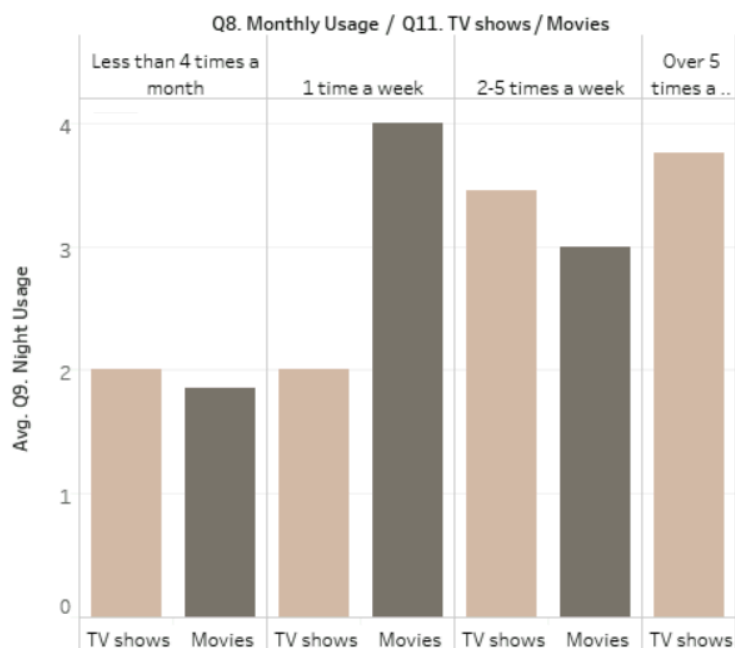

- How many times during a given month do you use Netflix?
- How often do you use Netflix at night?
- How likely are you to use Netflix over other streaming services?

Survey Set-up & Methodology (CRISP-DM):

To start off, for the survey, we used a convenience sample. There is a couple of reasons why we use this sampling technique. We mainly use this because it is vital to get the results in a short period of time which we targeted to be exactly one week. We also use this sampling because we want to target the audience who are specifically Netflix users that are in college. We construct the survey using Google Form and distribute it using the link and through our social media to our family and friends. We chose this distribution method because our team consists of remote-learning students, and in consideration of the COVID-19 pandemic that limits our real-life social contact. Due to convenience sampling, the survey responses show a large percentage of first-year and second-year college students. There is also an overly amount of Asians that were total to half of the people who responded.

Data Analysis:

- How does preference between TV shows and Movies differ in the use of Netflix based on its monthly and nightly usage?

According to the data, respondents who prefer TV shows over movies tend to use Netflix more frequently. One of the possible reasons for this is because a TV show requires a large amount of time to finish. Whereas the average duration of a movie is usually only one up to four hours long. As you can see from the data, users who use Netflix more than once a week are more likely to use Netflix during the night regardless of their preference.

b. How does Netflix as a main streaming platform affects user satisfaction?

Row Labels	Average of Q1. NPS Question
1	5.00
2	8.00
3	6.67
4	8.20
5	9.33
Grand Total	8.00

Based on the question of how likely people are to use Netflix as their primary streaming service, respondents who always use Netflix as their top streaming platform are more likely to be satisfied. However, those who use Netflix alongside another platform might differ in their personal user satisfaction. Because the satisfaction itself can be influence by many aspects.

Prescriptions and Predictions

Knowing that sleep is Netflix biggest competition, from this data it can be analyzed that some students who prefer TV shows, spent more time in Netflix and mostly during the night. One prescription that came out from this data is that Netflix should constantly offer and provide new existing TV shows to help them terminate their rival.

The other prediction for the platform data is that in order to increase user satisfaction, it is important for Netflix to feature and provide various things that can be seen different from other platforms. Those who barely use Netflix are predicted to be less satisfied with it.
